
Halberd Corporation Reports Successful Conjugation of Metallic Particles & SARS-CoV-2 Proprietary Monoclonal Antibody

2021-06-17

Halberd Corporation announces the successful conjugation of gold-coated iron nanoparticles with Halberd's patent-pending monoclonal antibody against the SARS-CoV-2 spike protein. This milestone paves the way for testing to proceed on the elimination of disease through the application of extracorporeal radio frequency waves or laser emissive energy to bodily fluids of infected patients.

Dr. Mitchell S. Felder, [Halberd Corporation](#)'s Chief Technical Officer stated, "Although we were successful earlier in conjugating solid gold nanoparticles with Halberd's patent-pending monoclonal antibody, we found that the gold was not sufficiently reactive to the radiowaves to accomplish the efficient eradication of the disease antigen. Iron oxide nanoparticles are the ideal metal for this process. Unfortunately, we were unable to create a stable conjugation of the iron oxide with our patent-pending antibody. The gold-coated iron nanoparticle, by contrast, provides the combination of traits to satisfy both conditions:

- 1- Sufficiently reactive to radio waves and laser emissive energy, and
- 2- The ability to facilitate a stable conjugation.

Our patented extracorporeal approach to treatments is a necessary element to the eradication of disease through radiofrequency waves and laser emissive energy."

William A. Hartman, Halberd's Chairman, President & CEO, commented, "We commend the ingenuity and persistence of our team to seek a viable solution. We now have a road to success with the appropriate combination of metallic properties for the disease eradication process. This discovery was only possible with the careful study and testing by Dr. Qiang Chen of GreenBioAZ. With a suitable conjugation methodology achieved, we can now proceed with proof-of-concept testing at Youngstown State University (YSU) using E. coli as a first step. After successful completion of testing at YSU, pathogenic virus testing at a secure Level 3 laboratory will be conducted under the direct supervision of Dr. Chen and the

GreenBioAZ team, at the Arizona State University facility.”
